Additional Results of Augmented Questions

We provide more qualitative examples of augmented questions generated by our method with edit distance threshold $e = 4$ and top two semantic score. Questions that cause the answers to flip are presented in Fig. 2 and questions that preserve the answers are presented in Fig. 1.

Fig. 1. Examples of our generated questions that preserve the answers. The first question in bold in each block is the original question. The words in brackets are model predictions of the corresponding question with positive predictions in green and negative predictions in red. The numbers in brackets are the semantic scores of generated questions.
